A PROJECT REPORT

ON

BEAUTY SALON MANAGEMENT SYSTEM

Submitted to
Department of Computer Application
Ed-Mark College

In partial fulfillment of the requirements for the Bachelors in Computer Application

Submitted by
Anjali. Kumari Rauniyar.
TU Registration No:6-2-727-28-2021

Under the Supervision of
Mr. Shyam Maharjan

2025, JULY

Tribhuvan University
Faculty of Humanities and Social Science
Ed-Mark College

SUPERVISOR'S RECOMMENDATION

I hereby recommend that this project prepared under my supervision by Anjali Kumari Rauniyar. entitled “**Beauty salon Management System**” in partial fulfillment of the requirements for the degree of Bachelor of Computer Application is recommended for the final evaluation.

Project Supervisor

Mr. Shyam Maharjan

Department of Bachelor in Computer Application

Ed-Mark College

Kalanki, Kathmandu

Tribhuvan University

Faculty of Humanities and Social Science

Ed-Mark College

LETTER OF APPROVAL

This is to certify that this project prepared by **Anjali Kumari Rauniyar**, entitled “**Beauty salon Management System**” in partial fulfillment of the requirements for the degree of Bachelor in Computer Application has been evaluated. In our opinion it is satisfactory in the scope and quality as a project for the required degree.

ACKNOWLEDGMENT

I would like to express my heartfelt gratitude to all the individuals who have been instrumental in the successful completion of my project, " Beauty salon Management System." Their unwavering support, guidance, and encouragement have been invaluable throughout this journey.

First and foremost, I extend my sincere appreciation to my supervisor, Mr. Shyam Maharjan. His expertise, insightful suggestions, and continuous motivation have been the guiding force behind the project's progress. His mentorship has nurtured my skills and inspired me to overcome challenges with determination.

I am deeply thankful to Er. Sanjay Kumar Sah, the Coordinator, for his support and coordination. His enthusiasm and dedication in overseeing this project have been crucial in ensuring a smooth workflow and aligning all aspects towards the project's success.

Furthermore, I want to express my gratitude to everyone who directly or indirectly contributed to this endeavor. To my fellow classmates and friends who provided me with constructive feedback and encouragement, thank you for being an integral part of this process.

Last but not least, I want to acknowledge the unwavering support and understanding of my family throughout this project. Their encouragement and belief in my abilities have been my pillar of strength.

In conclusion, I recognize the collective efforts and contributions of all those involved in making " Beauty salon Management System " a reality. Without their support, this project would not have been possible. I am grateful for the knowledge and experience gained, and I look forward to the positive impact that this project will have on the Online Beauty Salon landscape in Nepal.

Thank you all for being a part of this incredible journey.

Sincerely,

Anjali Kumari Rauniyar.

ABSTRACT

The Beauty Parlor Management System is a digital tool designed to simplify salon operations. It helps manage appointments, services, staff, in an easy and organized way. Customers can book appointments online, and the system uses the First-Come-First-Serve (FCFS) method for scheduling. It also recommends services based on customer history using Content-Based Filtering. Salon owners can track daily activities, view reports, and improve customer service with less effort. This system saves time, reduces manual work, and enhances the overall salon experience. It allows customers to schedule services online based on availability, while salon staff can efficiently manage appointments, staff assignments, and stock of beauty products. This solution improves customer experience, reduces manual errors, saves time, and helps salon owners monitor business performance effectively. It also helps track beauty products and sends alerts when stock is low. With user-friendly design and secure data handling, the system improves the overall experience for both salon staff and clients. It saves time, reduces paperwork, and helps the parlor run smoothly. The Beauty Parlor Management System is a software application designed to make salon tasks easier and faster. It allows salon owners to manage appointments, services, employees, customer details, in one place. Customers can book services online using their phones or computers, and appointments are handled using the First-Come-First-Serve (FCFS) method to ensure fairness. The system also suggests services to customers based on what they booked earlier, using Content-Based Filtering.

Keywords: Beauty salon , Service Management, Staff, Inventory, Customers..

CHAPTER 1

INTRODUCTION

1.1 Introduction

Beauty salon Management System is a web-based application with appointment scheduling functionality to streamline and automate the operations of a beauty salon or spa. It provides the interface between the salon and clients to streamline the operations of a beauty parlor. It helps manage appointments, customer records, billing, inventory, and staff schedules efficiently. It automates appointment scheduling, customer management, staff management, billing, and inventory management. This system enhances efficiency, reduces errors, and improves customer experience. This system saves time, reduces mistakes, and improves customer service.

Nowadays, people expect quick and smooth services. Managing a beauty parlor manually can be difficult, leading to scheduling problems, wasted time, and unhappy customers. With a proper system in place, appointments can be scheduled without confusion, inventory can be checked automatically, and customer details can be stored for better service [1].

Technology is changing businesses everywhere, and beauty parlors can also benefit from it. By using this system, they can work more efficiently, manage money better, and keep customers happy. This report explains the main features of the Beauty Parlor Management System, how it works, and the benefits it offers to both business owners and customers. In this web application clients take an appointment online and salon administrators approves and cancel that appointment.

The Beauty salon Management System is a useful tool for beauty salons to handle their daily tasks efficiently. By using this system, parlors can provide better service, manage their resources well, and grow their business successfully. It is a service-oriented establishment in which women receive treatment to increase their beauty. Skin care, facial make up, hair nourishment and model hair cutting are the most important nourishing activities of a beauty parlor.

The beauty industry, particularly beauty parlors, holds a significant place in modern society, offering a wide array of services ranging from hair care to skincare. These establishments serve as havens, where clients entrust their well-being to them, seeking enhancement and relaxation [2].

1.2 Problem Statement

Managing a beauty salon manually is challenging and inefficient. The traditional approach involves paper records, phone call bookings, and manual tracking of inventory and staff schedules. This can result in appointment conflicts, mismanaged customer data, loss of revenue, and difficulty in maintaining inventory levels.

The statement of the problem includes:

- Overlapping or missed appointments due to manual scheduling.
- Difficulty in keeping track of customer preferences and visit history.
- Running out of essential beauty products or overstocking due to lack of proper tracking.
- Inefficient allocation of staff to appointments, leading to workload imbalance.

1.3 Objectives

The objectives of implementing Beauty salon Management System are:

- i. To develop a Salon Management System for booking appointments, managing services, and customer records.
- ii. To enable customers to explore services, book appointments, and find stylists based on various criteria using Recommendation system.

1.4 Scope and Limitations

Scope:

- **Online Appointment Booking**
Customers can schedule, reschedule, or cancel appointments through the salon's website or app, eliminating the need for phone calls or in-person visits.
- **Customer Information Management**
The system stores customer details, including contact information, service history, and preferences, allowing for personalized service and easy follow-ups.
- **Service Catalog Management**
The system maintains an up-to-date list of services offered, along with descriptions and pricing, making it easy for customers to choose services.
- **Reporting**
Generates reports on sales

Limitations:

- Additional security measures may be required for robust protection against potential threats, especially in a production environment.
- Scalability considerations is important to accommodate potential increases in user traffic and data volume over time.
- Accessibility and localization features may need to be considered to ensure inclusivity and support for users with diverse needs and languages.

1.5 Report Organization

Report organizing for each chapter that has been documentation is refer to specific format and it is easy to understand by the readers for the whole of the report. This report is begun with the chapter 1 that consists of the introduction, problem statement, objectives, scopes and limitations of the system. For the next chapter it explains about the background study and literature review which explains about related paper for the similar system. For the chapter 3, it discussed about the system analysis, requirement analysis (functional and non-functional), feasibility analysis (economical, technical, operational, schedule) and data modeling, process modeling, system design (architecture design, database schema design, physical DFD) that has been used during the development of the system and system design. Then for chapter 4 deals with the implementation process and testing process. Lastly, chapter 5 consists of conclusion on the project development and future recommendation.

CHAPTER 2

BACKGROUND STUDY AND LITERATURE REVIEW

2.1 Background Study

In 1888, Martha Matilda Harper, a Canadian entrepreneur, established the first public beauty salon in Rochester, New York, introducing a new model for beauty services that included standardized treatments and customer comfort [3].

Over the years, beauty salons have expanded their offerings beyond hair care to include services like skincare, nail care, and spa treatments. They have become essential establishments in the beauty and wellness industry, catering to a diverse clientele seeking various personal care services. With the advancement of technology, there is a growing need to integrate digital solutions into salon operations to enhance efficiency, customer satisfaction, and overall service quality [4].

A study of the existing Beauty salon Management System like Parlor Sewa by Murarkey, Midas Touch Nepal, Beauty Parlor Kathmandu Home Service, Hair n Shanti Nepa, Melong Salons and found the following strengths and weaknesses for improvement.

Parlor Sewa by Murarkey: Offers home service, trained beauticians, a wide range of beauty services. Weaknesses: Limited availability outside major cities, possible delays in service delivery, pricing might be higher than local salons [5].

Midas Touch Nepal Strengths: Professional beauty services at home, accessible customer service, good reviews. Weaknesses: Limited coverage, may have booking issues during peak hours, fewer package options [6].

Beauty Parlor Kathmandu Home Service Strengths: Home service, flexible appointments, direct communication via Viber/WhatsApp. Weaknesses: No dedicated app or website, may have inconsistent service quality, availability depends on beauticians' schedules [7].

Hair n Shanti Nepal Strengths: Well-established salon, professional hair and beauty treatments, trained staff. Weaknesses: Expensive services compared to local salons, no home service, requires advance booking [8].

Melong Salon Strengths: Unisex salon, social cause support (charity donations), variety of services.

- Weaknesses: No mobile beauty service, limited locations, long waiting times during rush hours [9].

2.2 Literature Review

The term “Beauty Salon” refers to a commercial establishment that offers a variety of cosmetic and personal care services, including hair styling, skincare, nail treatments, and makeup application. Beauty salons have evolved significantly over time, transforming from small, locally owned businesses to modern, technology-driven service providers. Historically, beauty treatments were often performed at home or in small community settings. However, the growth of the beauty and wellness industry has led to the establishment of professional salons that provide specialized services using advanced equipment and high-quality products.

A Beauty Salon Management System plays a crucial role in streamlining operations such as appointment scheduling, customer management, and service tracking. Traditional manual methods often lead to inefficiencies, including overbooking, scheduling conflicts, and difficulty in tracking customer preferences. Research indicates that the adoption of digital salon management systems significantly improves operational efficiency, reduces human error, and enhances customer satisfaction.

Several studies highlight the transition from manual to automated scheduling, with AI-powered systems and cloud-based databases offering real-time access to appointments and customer records. Furthermore, Customer Relationship Management (CRM) systems in salons have proven to be beneficial, as they enable businesses to store customer preferences, send automated reminders, and personalize services, ultimately increasing customer retention. A study by Smith & Brown (2020) emphasizes that loyalty programs, personalized recommendations, and automated follow-ups increase customer retention by over 35% [10].

Technological advancements have further enhanced salon management. The integration of mobile applications, online payment systems, and AI-driven recommendations has improved customer engagement and operational efficiency. Studies show that salons with dedicated mobile apps experience a 20-30% increase in bookings compared to those relying on traditional booking methods. Additionally, the integration of machine learning algorithms helps predict peak booking hours, allowing salons to optimize staff schedules and reduce idle time. Digital payments have become an essential feature in salon

management. Research by Johnson et al. (2021) highlights that mobile payments and online booking options increase customer satisfaction and reduce no-shows [11].

This study focuses on developing a Beauty Salon Management System aimed at streamlining salon operations, including appointment scheduling, customer management. By leveraging technology, the system seeks to address common challenges faced by salon owners and contribute to the modernization of salon management practices [12].

CHAPTER 3

SYSTEM ANALYSIS AND DESIGN

3.1 System Analysis

The Agile methodology is a collection of project management frameworks that break projects down into smaller phases. Agile relies on iterative cycles, allowing teams to adapt to changes and regularly refine their work. Agile methodology is a flexible and iterative approach to software development that can be effectively applied to a Beauty salon Management System to ensure continuous improvement and customer satisfaction. When applied to a Beauty salon Management System, Agile ensures that the software evolves based on customer needs, improves efficiency, and delivers a high-quality system with minimal delays. Here is the Agile methodology workflow diagram for the Beauty salon Management System.

Figure 1: Agile model of Beauty salon Management System [13]

3.1.1 Requirement Analysis

There are two types of requirement analysis:

i. Functional Requirements

Functional requirements are the specific capabilities and features that the system must possess to fulfill its intended purpose and meet the needs of its users. For the Beauty salon Management System, some of the functional requirements include:

For Admin:**Admin Management:**

- Admins have a separate login interface for accessing administrative functionalities.
- Admin authentication is secure and separate from regular user authentication.

Appointment Management:

- Admins or user is able to view a list of all appointment created by admin.
- They have the ability to edit or delete any appointment, including inappropriate or outdated ones.

User Management:

- Admins is able to view a list of all registered users.
- They have the ability to delete user accounts in case of policy violations or misuse

For Users:**User Registration and Authentication:**

- Users is able to register for an account by providing a username, email address, and password.
- Registered users is able to log in securely using their credentials (username/email and password).

Profile Management:

- Users is able to update their profile information, including username, email address, and password.

Get Appointment:

- Users is able to view a list of available appointment.
- They have the ability to select appointment by selecting their preferred option.

Use Case Diagram

In Beauty salon Management System, there are two actors such as admin and user where admin can login, manage users, manage appointment, users and logout from admin panel. Users register, login, get appointment and manage their account,.

Figure 3. 1:Usecase Diagram of Beauty salon Management System

ii. Non-Functional requirements:

- The interface of the system is user friendly.
- The data of the user is securely stored and protected.
- The system is compatible with all devices.
- The system is fast.

3.1.2 Feasibility Analysis

A feasibility study for Beauty salon Management System is crucial to assess the viability, benefits, challenges, and potential risks associated with its implementation. Here is a structured framework for conducting a feasibility study on Beauty salon Management System.

i. Technical Feasibility:

The system is technically feasible as the requirement for the development of the system is easily accessible. The necessary hardware and software required for the development and implementation of the system is available.

ii. Operational Feasibility:

Everyone has general knowledge and basic skills in using computers and the internet, so they can easily handle the project. The implementation is very easy. It runs on various platforms such as web pages, devices, and more. The simplicity of operation ensures that the project is effectively managed without requiring extensive technical expertise, making it operationally feasible.

iii. Economic Feasibility:

The system is economically feasible and cost effective. As all the tools and resources required are either open sources or free. Ongoing operational and maintenance costs, such as server hosting, software updates, technical support, and security measures, are considered. The initial investment cost for developing the platform is reasonable and can be recouped within a relatively short period.

iv. Schedule Feasibility

The system is complete within scheduled time. Here is the time schedule.

Phases	Feb21-March16	March17 -April30	May1-june 30	July	
Iteration	Sprint 1	Sprint 2	Sprint 3	Sprint 4	
Planning					
Designing					
Coding					
Testing					
Maintenance					

Figure 3. 2:Gantt chart of Beauty salon Management System

3.1.3 Data Modeling (ER-Diagram)

An Entity-Relationship (ER) diagram is a visual representation of the data model for a database system.

Figure 3. 3:Entity Relationship Diagram of Beauty Salon Management system

3.1.4 Process Modeling (DFD)

In context diagram, the Beauty salon Management System is at the center of the diagram. There are two external entities which are Admin and User that interact with the system. Users request for login, view appointment, manage their account, get appointment the other hand Admin logs in and manages the users and appointment. These diagrams provide a high-level overview of the data flow and interactions within the system from both the user and admin perspectives.

Figure 3. 4:Context level Diagram of the Beauty salon Management System

A Level 1 Data Flow Diagram (DFD) is the next level of decomposition after the context-level diagram. It breaks down the high-level processes in the context-level diagram into more detailed sub-processes, showing the data flows between them. Level 1 DFD provides a more comprehensive view of the system's functionality, helping to understand the data flow and processing within the system.

Figure 3. 5:level 1 DFD of the Beauty salon Management System

3.2 System Design

System design is the process of defining the architecture, components, and functionality of a software system. It involves creating detailed specifications, diagrams, and plans that outline how the system will be built and function. The the Beauty salon Management System is designed using various schema design, CASE tools and is described using following designs.

3.2.1 Architecture Design

Architecture design is the process of creating a blueprint for a software system, outlining its structure, components, and interactions. It defines the system's overall organization, ensuring it meets functional and non-functional requirements. Architecture design serves as the foundation for the development and implementation of the software.

The architecture of MYSQL describes the relationships among the different components of the MYSQL System. It follows Client-Server Architecture. It is designed so that end users can access resources from the Computer that is the server using networking services. The Architecture of MYSQL contains the following major layers:

Client Layer

MySQL does not have a unique top layer, i.e., client. Network tools provide authentication, security, and connection handling in client-server models.

Server Layer

MySQL's second layer, or server, is the heart and soul of the database. It includes many operations, such as query parsing, optimization, analysis, caching, and all the built-in functions (e.g., dates, times, math, and encryption). At this level, any functionality, such as stored procedures, triggers, and views, can be used across storage engines.

Storage Layer

All MySQL data is stored and retrieved in the storage engine's third layer. There are a few storage engines commonly used, including MyISAM and InnoDB. Storage engines communicate with MySQL servers using API.

Figure 3. 6:Architecture design of the Beauty salon Management System

Figure 3. 7:Flowchart of Beauty salon Management System

3.2.2 Database Schema Design

Database schema design organizes the data into separate entities, determines how to create relationships between organized entities, and how to apply the constraints on the data. In the figure below, there are five tables in the database each of them has their own fields and identified with their respective primary key which when used in anther table, becomes a foreign key. The fields in each entity table have data type according to the data it stores. The cardinality is shown by the arrows as shown in the diagram:

Figure 3. 8:Database Schema Design of Beauty salon Management

3.2.3 Interface Design

User interface is the front-end application view to which user interacts in order to use the software. It is used to build interfaces in system focusing on looks and styles. Here, it is design user friendly interfaces so that users find easy to use and pleasurable. The following are the UI design of home page, login page, sign up page, user dashboard and admin dashboard.

User Interface

Menu

Title

First Name

Last Name

Email

Mobile No.

Password

R.Password

Sign up

Figure 3. 9:Register page of Beauty salon Management System

The login page layout consists of a main container with a 'Menu' bar at the top. Below the menu is a 'Title' bar. The main content area contains an 'Email' input field, a 'Password' input field, and a 'Login' button. A 'Forgot Password' link is positioned to the left of the password field.

Figure 3. 10:Login page of Beauty salon Management System

The dashboard page layout for a user includes a 'Menu' bar at the top, followed by a 'Title' bar. Below these, there are six service buttons arranged in a 2x3 grid, labeled 'Services 1' through 'Services 6'.

Figure 3. 11:Dashboard page of User

The dashboard page layout for an admin features a 'Title' bar at the top and a circular 'Admin' profile icon on the right. A vertical 'Menu' bar is located on the left side. The main content area displays six summary cards in a 2x3 grid: 'Total customer', 'Total Appointment', 'Accepted Appointment', 'Rejected Appointment', 'Total Services', and 'Total sales'.

Figure 3. 12:Dashboard page of Admin

Figure 3. 13:Admin Login

3.2.4 Physical DFD

A Physical Data Flow Diagram (DFD) for an Beauty salon management system depicts the tangible components and interactions involved in its implementation. At the forefront lies the User Interface, which serves as the platform through which users engage with the system, comprising web pages and interactive elements. Supporting this interface is the Web Server, responsible for hosting the web application and handling user requests, while generating dynamic content in response. The Application Server operates behind the scenes, managing the system's logic and functionality, processing data, and facilitating communication with the Database Server. The Database Server acts as the repository for storing and managing data pertinent to the system, including user profiles, poll questions, and responses. Lastly, the Network Infrastructure comprises the physical and logical components facilitating communication between system elements. Together, these components form the backbone of the Beauty Salon Management system, orchestrating user interactions, data processing, and system operations within its architecture. This Physical DFD serves as a blueprint, guiding the implementation and deployment of the system's infrastructure and technology stack.

3.3 Algorithm Details

1. Personalized Recommendation

a. Recommendation System Algorithm

Objective:

To suggest relevant services to users based on their past behavior or overall service popularity.

Working:

- For a logged-in user, the system retrieves all services that they have not booked yet.
- This helps users explore new services that they haven't experienced before.

Algorithm Steps:

- i. Get the current user ID from the session.
- ii. Fetch all ServiceIDs the user has already booked from the tblbook table.
- iii. Select services from tblservices whose IDs do not appear in the user's booking history.
- iv. Limit results to top 5 recommendations.

Mathematical Model:

Mathematical Model:

- i. Let: UU = set of all users.
- ii. SS = set of all available services.
- iii. $B(u) \subseteq S$: services already booked by user $u \in U$.
- iv. $R(u) = S \setminus B(u)$: services not yet booked by user u .
- v. $Top5(R(u))$: top 5 from $R(u)$ (can be selected randomly or by a secondary ranking).

Final Output:

$$R5(u) = Top5(S \setminus B(u))$$

The personalized filtering method gives suggestions based on each user's past bookings. When a user logs in, the system checks which services they have already booked. Those services are removed from the list of recommendations. Instead, the system shows services that the user has not tried yet. This helps the user explore new services. To make it simple, only the top five services are shown. These five services can be chosen either randomly or

by using some ranking, such as most liked by other similar users. This way, the user always sees new and useful options.

b. Popularity-Based Filtering (Top Services)

Working:

- The system recommends services that are most booked across all users.
- This gives exposure to trending and widely liked services.

Algorithm Steps:

- i. Join tblservices and tblbook tables on service ID.
- ii. Count the number of bookings for each service.
- iii. Sort services by booking count (descending).
- iv. Limit the output to top 5 services.

The popularity-based filtering method shows services that are popular among all users. The system looks at the booking records of every user and counts how many times each service has been booked. The more a service is booked, the more popular it is considered. The system then arranges the services from most booked to least booked. Finally, the top five services are selected and shown to the user. This way, even if someone is new to the system and has no booking history, they can still get good suggestions based on what most people like.

2. FCFS (First Come, First Serve) Scheduling Algorithm

Objective:

To allow booking appointments fairly without time conflicts. The earliest request gets the slot.

Working:

- i. User selects a date to book an appointment.
- ii. Backend checks the database (tblbook) for all appointment times already booked on that date.
- iii. A list of available time slots is defined in the code (e.g., 10:00 AM to 5:00 PM).
- iv. Time slots that are already booked are disabled in the booking form.
- v. When the user submits the form, if the selected slot is still available, it is booked

The appointment booking system uses the First Come, First Serve (FCFS) method to make sure time slots are fair and do not clash. When a user picks a date, the system checks which time slots are already booked for that day. The system has a fixed list of time slots, for example, from 10:00 AM to 5:00 PM. The slots that are already taken are marked as unavailable, and the user can only choose from the free ones. After the user selects a slot, the system checks again to make sure it is still free. If no one else has booked it yet, the system confirms the booking. If the slot is already taken, the user is asked to choose another one. This way, the first person to choose a slot gets it, and no two people can book the same time.

CHAPTER 4

IMPLEMENTATION AND TESTING

4.1 Implementation

Agile model applied to the development of an Beauty salon management system here, the requirements are well-defined and unlikely to change significantly

4.1.1 Tools Used

i. Front-End Tools

- **HTML:** This is used to create web pages.
- **CSS:** This is used to design web pages.
- **JavaScript:** This is used to create interactive web page.

ii. Back-End Tools

- **PHP:** This is used to handle forms, manage databases, and generate dynamic content.
- **XAMPP:** This is used to host this project.
- **MySQL:** This is used to managing a data for this project to generate dynamin content.

iii. CASE Tools

- **VS Code:** This is a lightweight code editor used to writing a code for this project.
- **MS Word:** This is used for documentation for this project.

4.1.2 Implementation Details of Modules

Different modules of this system are described as below:

Admin Module:

i. Authentication Module:

- This module handles admin login and authentication.
- It verifies admin credentials and grants access to the admin dashboard upon successful authentication.

```

if(isset($_POST['login']))
{
    $adminuser=$_POST['username'];
    $password=md5($_POST['password']);
    $query=mysqli_query($con,"select ID from tbladmin where UserName='$adminuser' && Password='$password'");
    $ret=mysqli_fetch_array($query);
    if($ret>0){
        $_SESSION['bpmsaid']=$ret['ID'];
        header('location:dashboard.php');
    }
    else{
        $msg="Invalid Details.";
    }
}
?>

```

ii. Appointment Module:

- This module allows admins to view, create, edit, and delete appointment.
- Admins can add services, delete services.

```

while ($row=mysqli_fetch_array($ret)) {
    ?>
    <tr> <th scope="row"><?php echo $cnt;?></th>
    <td><?php echo $row['AptNumber'];?></td>
    <td><?php echo $row['FirstName'];?> <?php echo $row['LastName'];?></td>
    <td><?php echo $row['MobileNumber'];?></td>
    <td><?php echo $row['AptDate'];?></td>
    <td><?php echo $row['AptTime'];?></td>
    <?php if($row['Status']==''){ ?>
    <td><?php echo "Not Updated Yet"; ?></td>
    <?php } else { ?>
    <td><?php echo $row['Status'];?></td><?php } ?>
    <td width="150"><a href="view-appointment.php?viewid=<?php echo $row['bid'];?>" class="btn btn-primary">View</a>
    <a href="all-appointment.php?delid=<?php echo $row['bid'];?>" class="btn btn-danger btn-sm" >Delete</a> </td> </tr> <?php
    $cnt=$cnt+1;
}
?>

```

iii. User Management Module:

- Admins can manage user accounts through this module.
- They can view a list of registered users, and perform actions such as accepting, rejecting appointment and deleting accounts.

```

if(isset($_POST['submit']))
{
    $name=$_POST['name'];
    $email=$_POST['email'];
    $mobilenum=$_POST['mobilenum'];
    $gender=$_POST['gender'];
    $details=$_POST['details'];

    $eid=$_GET['editid'];

    $query=mysqli_query($con, "update tblcustomers set Name='$name',Email='$email',MobileNumber="
    if ($query) {
        $msg="Customer Detail has been Updated.";
    }
    else
    {
        $msg="Something Went Wrong. Please try again";
    }
}

```

```

<?php
$ret=mysqli_query($con,"select *from tblservices");
$cnt=1;
while ($row=mysqli_fetch_array($ret)) {

    ?>

    <tr>
    <th scope="row"><?php echo $cnt;?></th>
    <td><?php echo $row['ServiceName'];?></td>
    <td><?php echo $row['Cost'];?></td>
    <td><input type="checkbox" name="sids[]" value="<?php echo $row['ID'];?>" ></td>
    </tr>
    <?php
    $cnt=$cnt+1;
    }?>
    <tr>

```

User Module:

i. Authentication Module:

- Similar to the admin module, this module handles user login and authentication.
- It verifies user credentials and grants access to user-specific functionalities upon successful authentication.

```

if (isset($_POST['signup'])) {
    $fname = $_POST['firstname'];
    $lname = $_POST['lastname'];
    $email = $_POST['email'];
    $mobno = $_POST['mobilenumber'];
    $password = md5($_POST['password']);

    $ret = mysqli_query($con, "SELECT Email FROM tbluser WHERE Email='$email' || MobileNumber='$mobno'");
    $result = mysqli_fetch_array($ret);
    if ($result > 0) {
        echo "<script>alert('This email or mobile number is already associated with another account. Please try again.');";
    } else {
        $query = mysqli_query($con, "INSERT INTO tbluser(FirstName, LastName, Email, MobileNumber, Password) VALUES('$fname', '$lname', '$email', '$mobno', '$password')");
        if ($query) {
            echo "<script>alert('You have successfully registered.');";
            echo "<script>window.location.href='login.php';</script>";
        } else {
            echo "<script>alert('Something went wrong. Please try again.');";
        }
    }
}

```

```

if(isset($_POST['login']))
{
    $emailcon=$_POST['emailcon'];
    $password=md5($_POST['password']);
    $query=mysqli_query($con,"select ID from tbluser where (Email='$emailcon' || MobileNumber='$mobno')");
    $ret=mysqli_fetch_array($query);
    if($ret>0){
        $_SESSION['bpmuid']=$ret['ID'];
        header('location:index.php');
    }
    else{
        echo "<script>alert('Invalid Details.');";
    }
}
?>

```

ii. Appointment Module:

- This module allows users to interact with services by viewing, getting appointment

```

<table border="1" cellpadding="8" cellspacing="0" style="width:100%; border-collapse: collapse;">
<tr><th>Appointment Number</th><td><?= htmlspecialchars($row['AptNumber']) ?></td></tr>
<tr><th>Name</th><td><?= htmlspecialchars($row['FirstName'] . ' ' . $row['LastName']) ?></td></tr>
<tr><th>Email</th><td><?= htmlspecialchars($row['Email']) ?></td></tr>
<tr><th>Mobile Number</th><td><?= htmlspecialchars($row['MobileNumber']) ?></td></tr>
<tr><th>Service</th><td><?= htmlspecialchars($row['ServiceName']) ?></td></tr>
<tr><th>Appointment Date</th><td><?= htmlspecialchars($row['AptDate']) ?></td></tr>
<tr><th>Appointment Time</th><td><?= htmlspecialchars($row['AptTime']) ?></td></tr>
<tr><th>Booking Date</th><td><?= htmlspecialchars($row['BookingDate']) ?></td></tr>
<tr><th>Status</th><td><?= htmlspecialchars($row['Status']) ?; "Not Updated Yet") ?></td></tr>
<tr><th>Amount to Pay</th><td>Rs. <?= number_format($row['Cost'], 2) ?></td></tr>
</table>

<?php if ($row['PaymentStatus'] != 'Paid') : ?>

```

```

if (isset($_POST['submit'])) {
    $adate = $_POST['adate'];
    $atime = $_POST['atime'];
    $msg = $_POST['message'];
    $serviceid = $_POST['serviceid'];
    $aptnumber = mt_rand(100000000, 999999999);

    // Server-side date validation
    $today = date('Y-m-d');
    if ($adate < $today) {
        echo "<script>alert('Booking date cannot be in the past.');

```

iii. Profile Management Module:

- Users can manage their profile information and account settings through this module.
- They can update their username, email address, password, and other profile details.
- There may be additional features such as password recovery and account deletion.

```

} else{
if(isset($_POST['submit']))
{
    $uid=$_SESSION['bpmsuid'];
    $fname=$_POST['firstname'];
    $lname=$_POST['lastname'];
    $query=mysqli_query($con, "update tbluser set FirstName='$fname', LastName='$lname' where ID=$uid");

    if ($query) {
        echo '<script>alert("Profile updated successfully.")</script>';
        echo '<script>window.location.href=profile.php</script>';
    }
    else
    {
        echo '<script>alert("Something Went Wrong. Please try again.")</script>';
    }
}
}

```

4.2 Testing

Table 4. 1:User Registration Testing

S.N	Input				Expected output	Actual Output	Test Result
	First Name	Last Name	Username	Password			
1	Anjali	Rai	-----	Anjali123	Fail	Fail	Success
2	Anjali	Rai	anjali@gmail.com	Anjali123	Pass	Pass	Success
3	Anjali	Rai	anjali@gmail.com	Anjali123	Pass	Already existing	Success

Table 4. 2:User Login page Testing

S.N	Input		Expected output	Actual Output	Test Result
	Username	Password			
1	-----	Anjali123	Fail	Fail	Success
2	anjali@gmail.com	Anjali123	Pass	Pass	Success
3	anjali@gmail.com	Anjali123	Pass	pass	Success

Table 4. 3:Admin login page Testing

S.N	Input		Expected output	Actual Output	Test Result
	Username	Password			
1	-----	Admin123	Fail	Fail	Success
2	admin@gmail.com	Admin123	Pass	Pass	Success

3	admin@gmail.com	Admin123	Pass	pass	Success
---	--	----------	------	------	---------

Table 4. 4:Book Appointment page Testing

S.N	Input				Expected output	Actual Output	Test Result
	User Name	Service Name	Appointment Time	Booking Date	--	--	--
1	Anjali	facial	-----	2025/5/4	fail	Fail	Success
2	Anjali	Hair cut	10:00	2025/7/10	Pass	Pass	Success
3	Anjali	Bridal makeup	1:00	2025/5/2	Pass	pass	Success

Table 4. 5:software testing

Input	Value	Expected outcome	Boundry value
First Name	Maxlen=51	Invalid	0 and 50
Last Name	Maxlen=29	Valid	0 and 50
User Name	^(.+)(@)(.+) \$	Valid	-----@gmail.com
Password	Minlen=5	Invalid	6 and 50

Table 4. 6: System testing

Test Id	Test Scenario	Test Data	Expected Result	Actual Result	Test Result
T1	Login	Email, Password	Successfully login	pass	Success
T2	Register	FirstName, LastName, Email, password	Successfully Register	pass	Success
T3	Get appointment	Add or update appointment	Selected/rejected	pass	Success
T4	Manage user	Delete or Add user	Managed user	pass	Success
T5	Manage appointment	add, delete, or update appointment	Successfully Created, deleted, Updated appointment	pass	Success

CHAPTER 5

CONCLUSION AND FUTURE RECOMMENDATION

5.1 Lesson learnt/Outcome

After developing and implementing Beauty Salon Management system site there are various lesson that we figure out and learnt like:

- Learn how to do system analysis and feasibility study.
- Learn full cycle of development process.
- Learnt to integrate the system UI with database.

5.2 Conclusion

In conclusion, the Beauty Salon System streamlines and enhances the overall efficiency of salon operations by automating key functions such as appointment booking, customer management, service management. It saves time by reducing manual work and helps avoid mistakes. The system is easy to use for both salon staff and customers. It also makes the salon look more professional and organized. Overall, this project shows how using technology can improve the way a salon works and make customers more satisfied.

This project provides user-friendly platform for creating services, and analyzing appointment, the system offers numerous benefits to users, administrators, and stakeholders alike. With this system, customers can book appointments online without calling or waiting. The implementation of front-end and back-end tools like HTML, CSS, JavaScript, PHP, XAMPP, and MySQL resulted in an efficient and user-friendly interface.

5.3 Future Recommendation

Future Recommendations for the Beauty Salon Management system.

- **Improved User Interface.** This project is not focused on user interface. So there is room for improving UI, which helps more interactive to the user.
- **Mobile Compatibility:** This project mainly focused on desktop view. This project needs to be responsive towards smaller devices like smartphones.
- **Enhanced Security Measures:** Strengthen security measures to safeguard user data and protect against potential threats such as hacking or data breaches, ensuring user trust and confidence in the system.

- **Feedback Mechanism:** Provide a feedback mechanism for users to submit suggestions, report issues, or request new features, allowing for continuous improvement based on user input.
